

COMPLEX PERIPHERAL MODULE

Abstract

A complex peripheral module has a housing and a main board.

The housing forms an assembly space having a standard height.

The complex peripheral module further has a plurality of peripheral devices, a frame, and a signal transferring device. The frame has a containing chamber such that the peripheral devices are stacked and contained in the containing chamber. The frame is combined with the housing to be mounted in the assembly space. Signals are transmitted from the peripheral devices to the main board via the signal transferring device.
